

What can we learn from research?

Research

- Many descriptions
- Research: inconsistent or mixed findings:
 - F2F communication
 - no differences between F2F and CMC
 - negative effects of F2F communication
- No distinction between different types of e-mediation

Types

Hybrid

- Online intake:
 - Typewritten messages
 - Human mediator
 - No direct contact between the parties
- Offline conflicts: hierarchical labor conflicts

Online intake

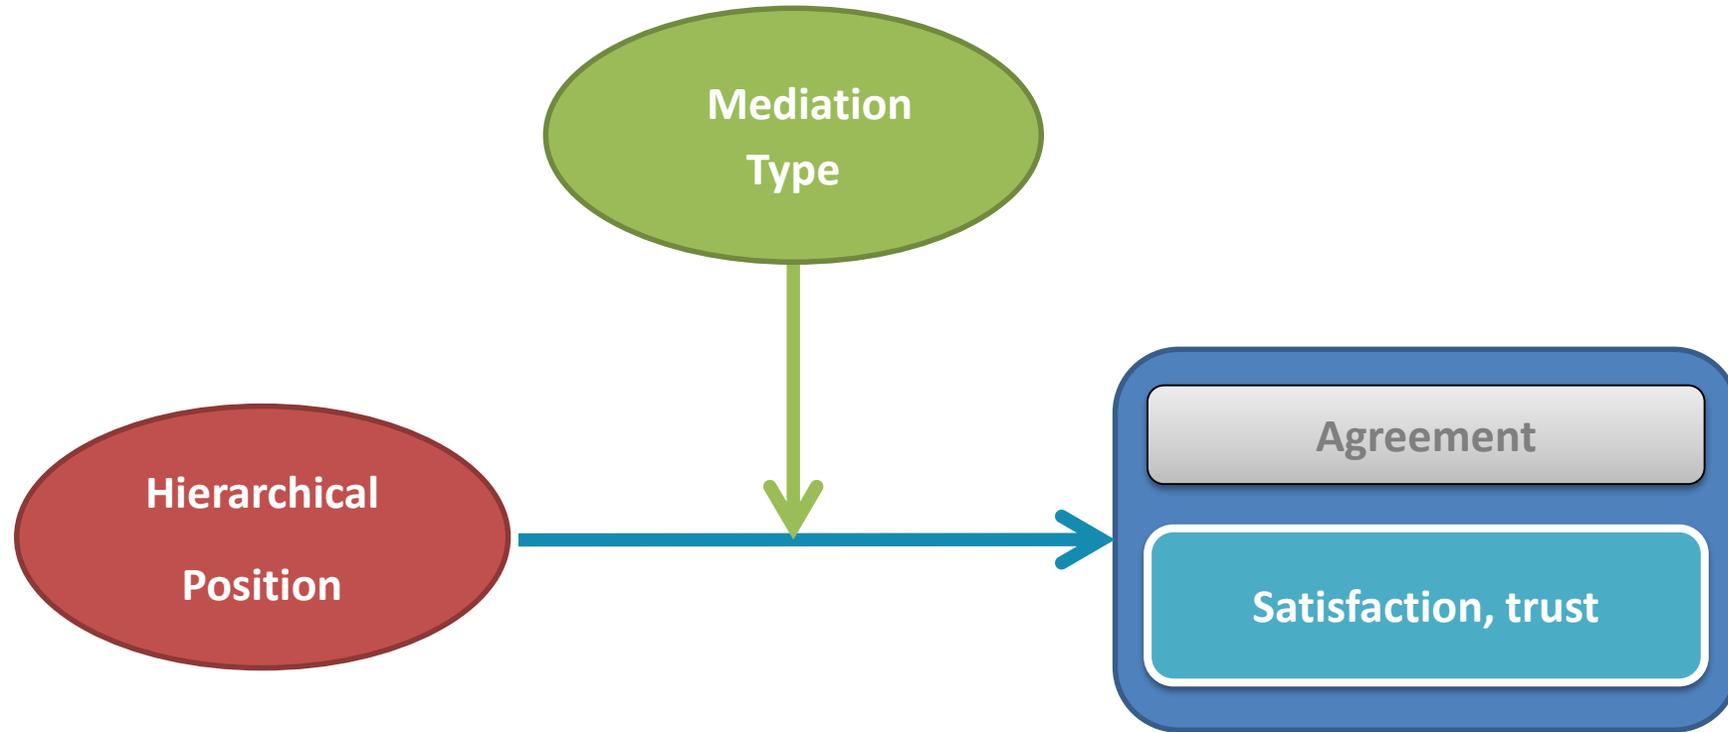

- Previous research in F2F mediations:
 - both supervisors and subordinates feel satisfied with mediation
 - supervisors feel significantly more satisfied
 - The perception of procedural fairness and the experience of recognition on the part of the mediator is esp. crucial for subordinates

Anderson et al., 2003; Keltner et al 2004

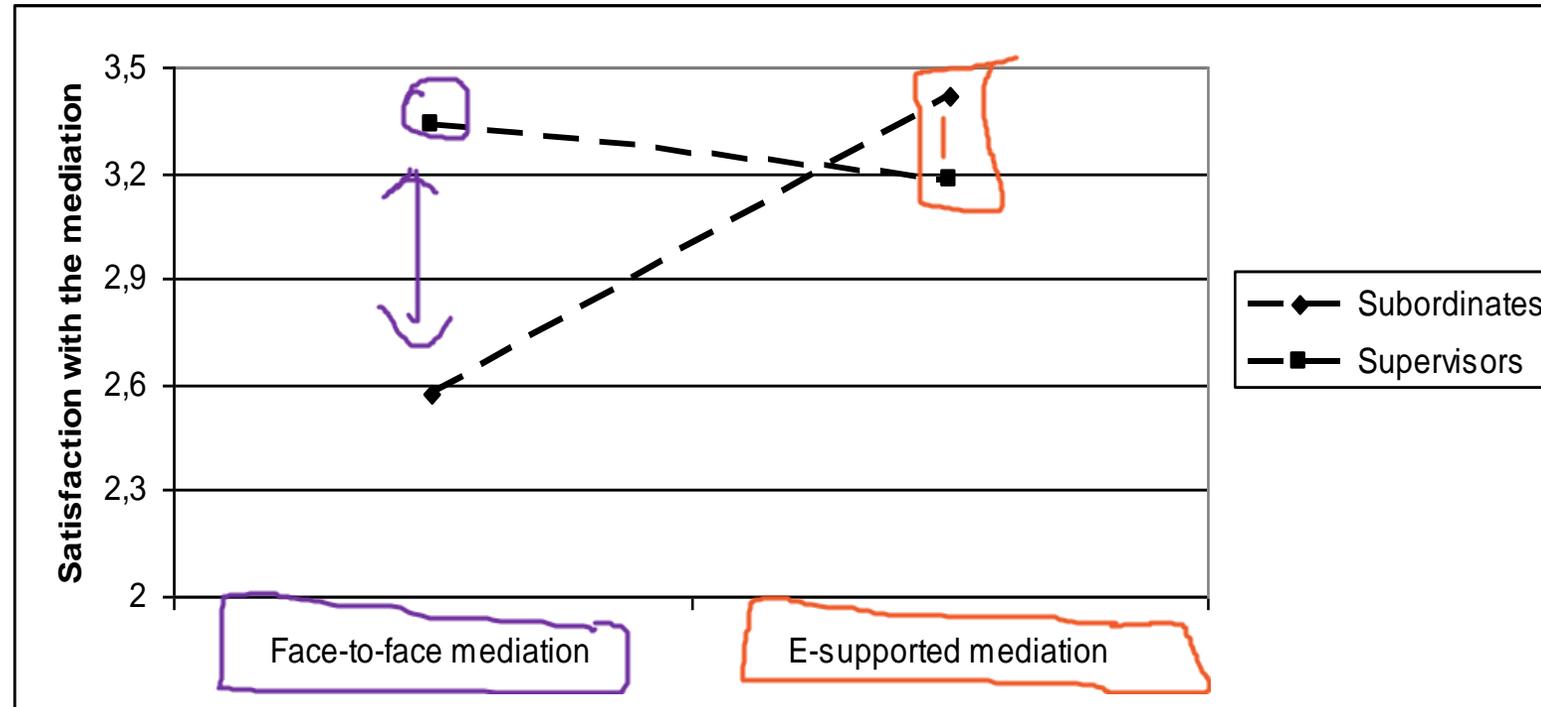

High power – free	Low power – shackles
Confront – approach	Avoid or withdraw - inhibition
Access to resources	Less access to resources

High power	Low power
Express emotions (anger) more easily	Refrain from expressing anger
Experience emotions (anger) less	Epistemic motivation (impact)
Little or no impact	Heavy impact

Hybrid

Satisfaction

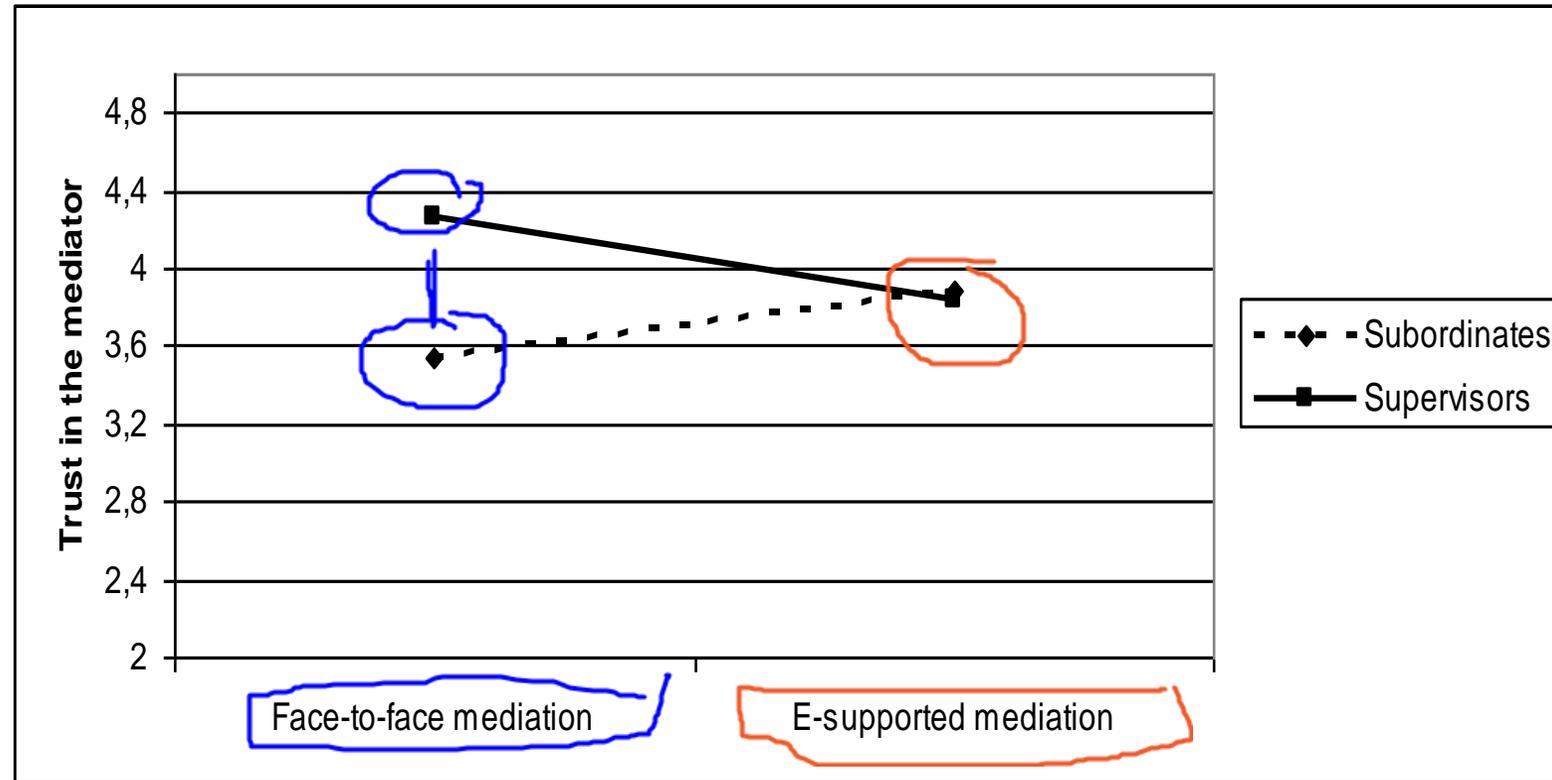

Face-to-face: $F(1,54) = 4,83$, $p < .05$

E-supported: $F(1,52) = 0,88$, $p = ns$

Controlled for
gender + age

Trust

Face-to-face: $F(1,54) = 7,98, p < .01$

E-supported: $F(1,52) = 0,07, p = ns$

Controlled for
gender + age

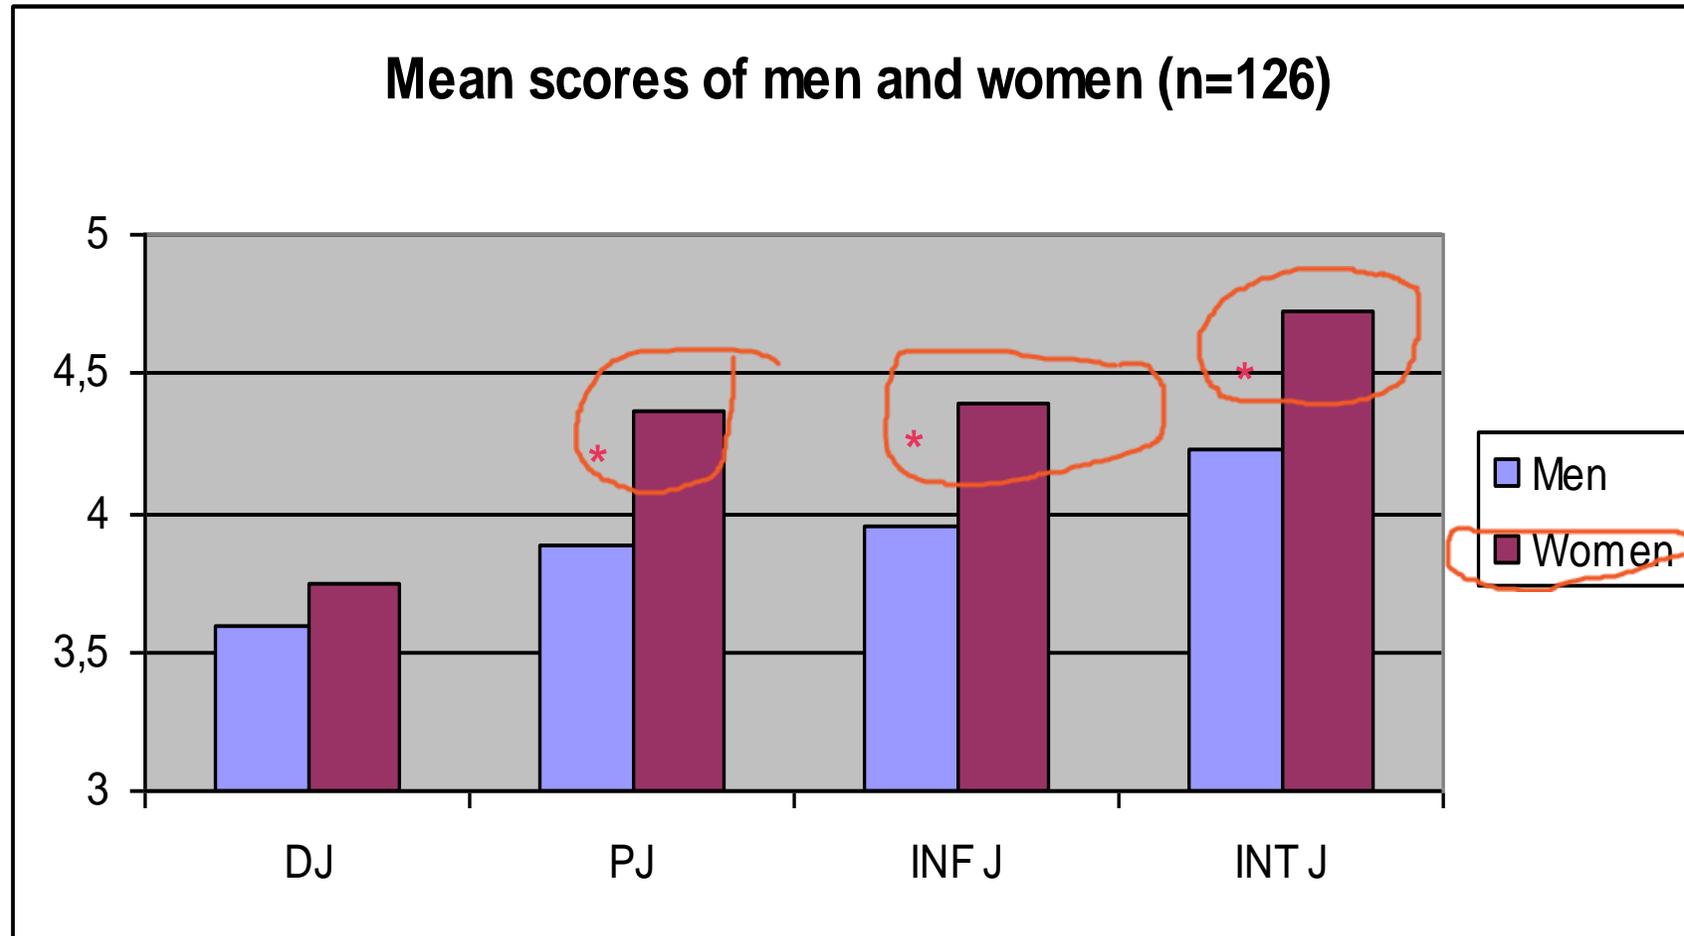

Conclusion

- Online tools: no negative effect on parties' perceptions of the mediation
- It seems that esp. the weaker party in the mediation benefits from the use of online tools
- Online tools may fulfill the needs of the one low in power (recognition, support and control), and hinder the more powerful party to exert influence directly

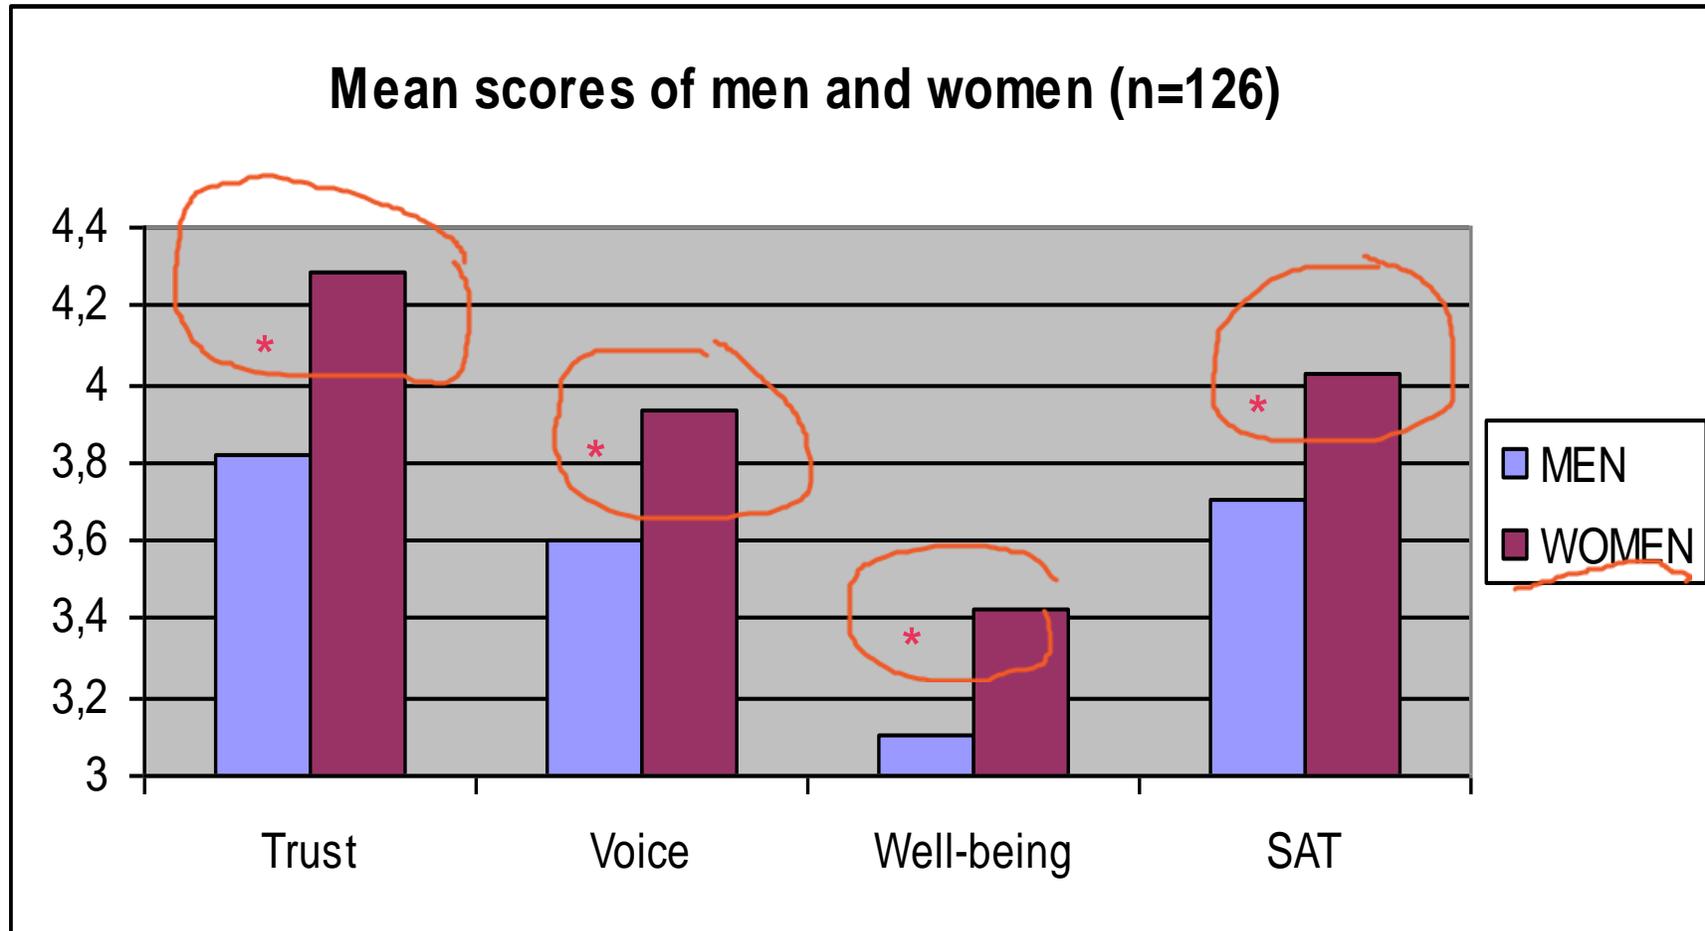

Fully e-supported

- Fully e-supported mediation
 - asynchronous communication
 - Human mediator edits the answers
 - No direct contact between the parties
 - Parenting plan
- 12 trained mediators – 80 couples
- Results: 76 % agreement; 8% partial agreement; 81% considers to use it again

Results

Results

Implications

- The type of communication channels to be used is determined by
 - parties' level of competitiveness (*How do they talk about/to each other?*), level of conflict escalation (*How emotional is the conflict?*)
 - The level to which parties have insight in the situation

Implications

- Asynchronous communication to
 - create cooperative mindset
 - decrease the level of conflict – vent emotions
 - enhance parties' insight in the situation
 - establish trust in the mediator
- In one mediation, different types of communication channels may be used (as parties develop)
