This course will discuss concepts from the physical sciences, especially chemistry, that underpin both everyday cooking and haute cuisine. During each module we will visit, or be visited by, one or more world-famous chefs, who will show us the secrets of some of their remarkable creations. We will use these as inspiration to delve into the fundamental chemistry behind food and cooking. The chefs include José Andrés (ThinkFoodGroup, Minibar, Jaleo), Joanne Chang (Flour Bakery, Myers and Chang), Dominique Crenn (Atelier Crenn), Daniel Humm (Eleven Madison Park), Joan and Jordi Roca (El Celler de Can Roca), Enric Rovira (Master Chocolatier), Carme Ruscalleda (Sant Pau), and Bill Yosses (former White House Pastry Chef). There will also be demos and lectures by other leaders in the field, including Ferran Adrià (El Bulli Foundation), Dan Souza from America’s Test Kitchen, authors Harold McGee (On Food and Cooking, Keys to Good Cooking) and Nathan Myhrvold (Modernist Cuisine), as well as food scientist Dave Arnold (Cooking Issues).

At the end of the course, students will be able to explain how a range of cooking techniques and recipes work, in terms of the chemical transformations of food.

**Instructors**

Michael P. Brenner  
Glover Professor of Applied Mathematics  
Harvard University

Pia Sörensen  
Senior Preceptor in Chemical Engineering and Applied Materials  
Harvard University

David Weitz  
Mallinckrodt Professor of Physics and Applied Physics  
Harvard University

**Prerequisites**

Knowledge of high school physics and chemistry will be useful, but not required. We want everyone to be able to start and successfully complete this course without prior knowledge. Background material will be supplied in the form of review videos and practice problems—though the course will be more challenging without a high school level knowledge of chemistry, students are encouraged to explore the review materials and use the discussion forums to ask questions. Your fellow students can be great teachers, too!

**Course Overview**

The course is divided into six modules, each focusing on a scientific topic and visiting chef(s). Every module includes interactive video sequences and practice problems, as well as a homework and a lab. Most learners should be able to complete the course requirements in 5-7 hours per module. There are no exams.

To pass the course, you will complete the homework and labs by the end of the course. In addition, you will carry out a final project in which you conduct your own scientific study of some recipe or aspect of cooking. You will perform both the labs and final project in your own kitchen, or visit a friend
or family member to complete the experiments together! Once you have finished the experiment for each module, you can eat the results of your lab and share them with your friends and family.

The table below outlines the scientific topics, visiting chefs, and labs.

<table>
<thead>
<tr>
<th>Module</th>
<th>Visiting Chefs</th>
<th>Lab</th>
</tr>
</thead>
<tbody>
<tr>
<td>Food components and flavor</td>
<td>Daniel Humm (Eleven Madison Park)</td>
<td>Calibrate your equipment, and make a cola drink!</td>
</tr>
<tr>
<td></td>
<td>Joann Chang (Flour bakery)</td>
<td></td>
</tr>
<tr>
<td>Energy, temperature, and heat</td>
<td>Dave Arnold (Booker and Dax)</td>
<td>Heat transfer in beverages</td>
</tr>
<tr>
<td>Phase transitions</td>
<td>Joan Roca (el celler de can Roca)</td>
<td>Phase transitions of fats</td>
</tr>
<tr>
<td>Diffusion and spherification</td>
<td>Jose Andres (minibar)</td>
<td>Ceviche, diffusion in eggs</td>
</tr>
<tr>
<td></td>
<td>Dominique Crenn (Atelier Crenn)</td>
<td></td>

**Interactive Lectures**
In each module, we present an interactive video sequence, interspersed with online exercises and practice problems to help you gauge your learning as you watch the videos. Participation in these online exercises does not contribute to your grade.

**Textbooks**
Two texts will be useful for this course; both are supplemental, not required. **Recommended, but not required**, readings will be posted from these books for each module.

On Food and Cooking, Harold McGee, Scribner, 2004 (2nd edition)

On Food and Cooking will significantly enhance your understanding of this subject and serve as a truly invaluable resource and reference, both for this class and beyond. Harold McGee will join us throughout the class and give his insight into the subjects that we are studying.

Science and Cooking: A Companion to the Harvard Course is based on transcripts of the science videos and serves as a summary of the science that is covered in the course.

**Homework**
This class has five homeworks. All due dates are set at the end the course, to give everyone a chance to submit their work for credit despite busy schedules or having enrolled in the class late.

You can drop your lowest homework when calculating your final grade.

**Labs**
The first 5 modules each include a lab that allows you to experiment with the associated scientific concept in your own kitchen. As part of the lab you will make measurements and observations, and
submit these for credit. You will also complete different parts of a lab report for each experiment, so that you can think more about the labs and practice scientific writing, which you will need for the final project report. You can also opt to take a picture of your lab and share it with your peers. Since the labs illustrate concepts discussed in the lecture material for each module, we encourage you to work through them in conjunction with watching the lectures.

Final Projects
The last module of the course does not have a lab, but will instead be devoted to final projects. You will carry out your own scientific study of some recipe or aspect of cooking in your own kitchen, and focus on the kitchen science question that is of most interest to you.

Discussion Forum
Participation in the discussion forums is optional, and we encourage students to use the discussion forums to ask questions about concepts from lectures, lecture exercises and labs, and to post photos of their lab results each week. You should not directly discuss answers to homeworks or post walkthroughs of the solutions.

The course staff and Community Teaching Assistants who have taken the course in the past moderate the forums, and we encourage students to answer each other’s questions and upvote helpful answers. For some useful tips on how to navigate the discussion forum, please see, “Participating in Course Discussions” in the EdX Learner’s guide.

Grading
A passing grade in this class corresponds to successful of the assignments, with an average score of 60% or higher. The grade breakdown is as follows:

- Homework (5 total, drop lowest score) 35%
- Lab (5 total, drop lowest score) 35%
- Final project 30%

Certification
Online learners who demonstrate mastery of SPU27x course materials with a passing grade may earn an ID verified certificate of completion, which EdX will issue for a fee.

Other books and resources
The following books cover various aspects of the science contained in the course:
- The Science of Good Cooking, America’s Test Kitchen
- The Science of Cooking, Peter Barham
- The Science of Chocolate, Stephen T. Beckett
- Cookwise, Shirley Corriher
- Keys to Good Cooking, Harold McGee
- The Curious Cook, Harold McGee
- Modernist Cuisine, Nathan Myhrvold, Chris Young, and Maxime Billet
- Ratio, Michael Ruhlman

Several of the guest lecturers have written cookbooks, which may be of interest:
- A Day at El Bulli, Ferran Adrià
- A Perfect Finish: Special Desserts for Every Occasion, Bill Yosses
- Atelier Crenn: Metamorphosis of Taste, Dominique Crenn
- Eleven Madison Park, Daniel Humm and Will Guidara
- CR20: 20 Years of Sant Pau, Carme Ruscalleda
Flour: Spectacular Recipes from Boston’s Flour Bakery + Café, Joanne Chang
Flour, too: Indispensable Recipes for the Café’s Most Loved Sweets and Savories, Joanne Chang
I Love New York: Ingredients and Recipes, Daniel Humm and Will Guidara
Liquid Intelligence: The Art and Science of the Perfect Cocktail, Dave Arnold
Made in Spain, José Andrés
Sous vide Cuisine, Joan Roca

For a more advanced discussion of the scientific topics in the course:
Physical Chemistry of Foods, Pieter Walstra
